#### Abstract

In this research paper, the potential of human adenosine $A_{3}$ receptor antagonists in the development of prospective therapeutic cloned human adenosine A3 receptor subtype. Quantitative structure -activity relationship (QSAR) studies revealed that the activity is positively influenced by the presence of a aromatic $\mathrm{R}_{2}$ substituent conjugated with the triazole nucleus contributes significantly to the selectivity. The best QSAR model with good correlation coefficient ( $\mathrm{r}^{2}=0.94$ ), of high statistical significance ( $>99.9 \%$ ) well explained the variance in activity.

Keywords: QSAR, Adenosine A3 receptor, MLR

## I. INTRODUCTION

Adenosine is a physicochemical purine nucleoside that functions as an agonist and activates the A1, A2a, A2b, and A3 G proteincoupled membrane receptors. Almost every cell contains adenosine receptors. Both in peripheral organs and tissues and in the CNS, adenosine is crucial in a variety of pathophysiological situations. Bronchoconstriction, platelet aggregation
inhibition, lipolsis inhibition, sedation induction, vasodilation, reduction of heart rate and contractility, and promotion of gluconeogenesis are only a few of the physiological actions that adenosine can mediate[1-5].

Activation of $\mathrm{A}_{3}$ agonist causes stimulation of phospholipase D and the release of inflammatory mediators such as histamine from mast cells, which are responsible for inflammation and hypotension. $\mathrm{A}_{3}$ receptors block UV irradiation induced apoptosis in mast like cells[6].

Numerous compounds that act on A3 adenosine receptors have been the subject of quantitative structure activity relationship (QSAR) investigations. Topological, connectedness, lipophilicity, and quantum chemical descriptors are used in QSAR modeling of A3. The 1,2,4 triazolo [5,1-i] purine derivatives' adenosine receptor binding affinity data (Table 1) were employed for the current QSAR study[7-10].Table 1. Structural features, and adenosine receptor binding affinities of 1,2,4-triazolo [5,1-i] purine derivatives

Chemsketch 19 was used to design the chemical structures, which were saved as.mol files. The Dragon program was used to calculate the values of the 29 descriptors shown in Table 2. Indices are 2D descriptors that take into account the internal atomic arrangement of compounds and encode in numerical form information about
molecular size, shape, branching, the presence of heteroatoms, and multiple bonds. Indices are a very useful tool for QSAR, taking into account their simplicity and rapidity of computation. This is particularly valuable now as one can analyze structures used for QSAR studies prior to any high throughput synthesis and testing.

## II. MATERIALS AND METHODS

The QSAR analysis was carried out on the set of 35 compounds as shown in table 1 , taking the adenosine $\mathrm{A}_{3}$ agonists pC 3 as dependent and different topological parameters as independent parameters. The multiparameter regression analysis was executed on a personal computer using NCSS version 2019. The pearson correlation matrix was constructed to determine the inter-correlation between the physiochemical parameters used in QSAR analysis [11-14]. The correlation matrix that was produced is shown in Table 3. The descriptors that were used by the models are the mean
information content based on the vertex degree equality and the edge equality both.

The correlation matrix for the aforementioned indicators is presented in Table 3 and shows that there is significant correlation among the descriptors. From the correlation matrix we can also conclude that of the aforementioned indices is highly correlated with the activity. This means that it is possible to obtain a statistically significant mono-parametric model. Based on the correlation matrix we conclude that only multiparametric regressions involving combinations of the indices mentioned before may result in a statistically significant regression expression [1518].

The DRAGON software has been used for the parameterization of the compounds under study. This software offers several hundreds of descriptors from different perspectives relating to empirical, constitutional and topological indices characteristic to the molecules under multi-descriptor class environment. [19-23].

## III. 3. RESULTS AND DISCUSSION

To create relevant QSAR equations, several combinations of independent descriptors with some acceptable association with the adenosine A3 antagonists were tested using stepwise multiple regression analysis. The equations were statistically significant, with a correlation value of more than 0.8 and significant regression coefficient values of more than 99.9ultiple regression analysis was used to create relevant QSAR equations. The equations were statistically significant, with a correlation value more than 0.8 and significant regression coefficient values greater than $99.9 \%$. The number of regression equations with correlation coefficients greater than or equal to the one corresponding to unscrambled response data was tallied. The best model was chosen among the numerous models based on a high F-ratio, a low SE, R, and R2CV.values close to 1 .

## Model No. 1

$\mathrm{pC} 3=-20.0380( \pm 3.8378)+2.8958( \pm 0.4821) \mathrm{piPC} 09$

$$
\mathrm{N}=29
$$

$\mathrm{R}^{2}=0.5719$
AR2 $=0.5561$
$\mathrm{Se}=0.5544$
$\mathrm{F}-$ Ratio $=36.072, \mathrm{Q}=1.031$
Here and thereafter, $\mathrm{N}=$ number of data points, $\mathrm{R}=$ correlation coefficient, $\mathrm{SE}=$ standard error of estimation, and $\mathrm{F}=$ Fischer statistics. Because the piPC09 coefficient in Model No. 1 is high, the piPC09 has a positive correlation with inhibitory activity.

[^0]
## $\mathrm{Q}=0.2749$

Topological indices are numerical quantifiers of molecular topology and are sensitive to bonding patterns, symmetry, the content of heteroatoms, and the degree of complexity of atomic neighborhoods. Since the structure of a compound depends on information based on connectivity, it can reveal the role of structural or sub-structural information in a molecule in estimating biological activity.

## Model No. 3

$\mathrm{pC3}=20.1966( \pm 7.8518)+9.6724( \pm 0.9357) \mathrm{piPC} 09-$
$22.6869( \pm 3.4680) \mathrm{piPC} 02+0.0001( \pm 4.9066)$ IDMT
$\mathrm{N}=29$
$\mathrm{R}^{2}=0.8796$
AR2 $=0.8652$
$\mathrm{Se}=0.3055$
$\mathrm{F}-$ Ratio $=60.885$,
$\mathrm{Q}=2.8755$

## Model No. 4

pC3 = -
$9.6119( \pm 12.5853)+10.6092( \pm 0.8898) \mathrm{piPC} 09-$
20.5196( $\pm 3.1565) \mathrm{piPC} 02$
$+0.0002( \pm 5.2159)$ IDMT $+52.5167( \pm 18.5037) \mathrm{Xt}$
$\mathrm{N}=29$
$\mathrm{R}^{2}=0.9099$
AR2 $=0.8855$
$\mathrm{Se}=0.2698$
$\mathrm{F}-$ Ratio $=60.564$,
$\mathrm{Q}=3.372$
The QSAR models 3 and 4 are significant, with positive contributions from piPC09, IDMT, and Xt and an inverse contribution from piPC02 with inhibiton activity. After deleting outlier compound no.10, the final model becomes

[^1]$\mathrm{Q}=4.019$
The derived equations demonstrated the significance of the dependent variables, particularly the molecular multiple path count of orders 02 and 09 , IDMT (total information content on the magnitude of the distance), and Xt (total structure
connectivity index). The best model was QSAR model no. 5, which had the greatest regression coefficient $(\mathrm{R} 2=0.93)$ and explained $93.5 \%$ of the variation in activity. The model's low standard error of estimate (s) and high F value indicate that it is statistically significant.

We have undertaken a cross validation methodology for deciding the predictive power of the proposed model. It is necessary for a best model to have good statistics but this is not sufficient for good predictive potential.

The randomization test suggests that the
developed model have a probability of less than $1 \%$ that the model is generated by chance. The plot of observed vs predicted activity is shown in Fig. From the plot it can be sheen that MLR model is able to predict the activity of training set quit well (all Points are close to regression line) as well as external.

Figure 1: Plot of predicted versus experimentally observed inhibitory activities of under study molecules

Figure 2: Plot of residual against experimental values of pC 3

Figure 3. Graph of Ridge Regression

## IV. CONCLUSION

We have evaluated the selective binding of 1,2,4-triazolo[5,1-i]purine derivatives with human adenosine A3 receptor subtype

1. Structure activity relationships model indicated that parabolic relation of the A3 receptors binding affinity with the piPc09, IDMT and Xt.
2. The negative coefficient of piPC02 that an aromatic substituent conjugated with the triazole nucleus should be present at $\mathrm{R}_{2}$ position for the A 3 binding affinity.
3. Presence of a 4 substituted phenyl ring at R2 position also increases selectivity as evidenced from the positive coefficients of piPC09, IDMT and Xt .

## V. ACKNOWLEDGEMENTS

Dr. V.K. Agrawal, retired professor of chemistry at A.P.S. University, Rewa, provided invaluable advice and inspiration in carrying out this research. Dr. Shailja Sachan, associate professor, Dept. of Chemistry, M. S. Golvalkar College, Rewa, is especially grateful to UGC Bhopal for financial assistance in purchasing the NCSS and E-dragon software utilized in this work, which would not have been feasible without it.
