ABSTRACT
Polyherbal formulation has been used all round the world because of its healthful and therapeutic application. It has also known as a polyherbal therapy or herb- herb combination. Polyherbal formulations designed by the combination of multiple herbs exhibit ample advantages over a single herb and allopathic medicine. This resulted in the emerging trend in herbal drug therapy worldwide. People are using herbal and plant-based medicines from centuries for safety, efficacy, cultural acceptability, and lesser side effect. It is due to increase of awareness and knowledge about medicinal plants and their usage. There is also a realization that natural medicines are safer and allopathic drugs are often ineffective in several ailments. More than 700 mono and polyherbal preparation in the form of decoction, tincture, tablets, and capsules from than 100 plants are in clinical use. From this, polyherbal syrups are more effective and convenient to use. This article gives brief idea about recent advancement in development and evaluation of polyherbal formulations in the form of syrup for various therapeutic activities.

KEYWORDS: Polyherbal medicine ,Disease, therapeutics activity, chemical constituents

I. INTRODUCTION:
Herbal medicine is also known as phyto-medicine or herbalism it is a medicine that use plants or their crude products for the treatment of diseases. It may include also animal fungi or bacteria product. Since ancient era, herbal or plant-based medicines has been used for the prevention, cure & mitigation of diseases and time to time more and more herbal constituents of these natural sources are get enhanced. Herbal medicine has its origins in ancient cultures. It involves the medicinal use of plants to treat disease and enhance general health and wellbeing. Some herbs have potent (powerful) ingredients and should be taken with the same level of caution as pharmaceutical medications. In fact, many pharmaceutical medications are based on man-made versions of naturally occurring compounds found in plants. For instance, the heart medicine digitalis was derived from the foxglove plant. Herbal medicine aims to return the body to a state of natural balance so that it can heal itself. Different herbs act on different systems of the body. (1)

Syrup : Syrup is viscous, concentrated or nearly saturated aqueous solution of sucrose containing 66.7 % w/w of sugar.

It has mainly two types as:
a) Medicated syrup: Medicated syrups are nearly saturated solution of sugar in water in which medicaments and drugs are dissolved. It is intended for oral use.
b) Herbal syrup : An herbal syrup is prepared by mixing an concentrated decoction with either honey or sugar or alcohol. It is intended for oral use. Herbal syrups show an more potent action then other types of syrup.

Advantages:
• Good patient compliance.
• They are more palatable.
• Disguised the bad taste of medication

Disadvantages:
• During storage it causes an crystallization of the sugar within the screw cap.
• Not suitable in emergency and unconscious patients.
• Delayed onset of action because absorption takes time[6]
Method of preparation:
Simple syrup:
Mix 66.67% w/w of sucrose in required quantity of distilled water to prepare a concentrated solution of simple syrup [5].

Preparation of flavor solution
To prepare a flavor solution using Cardamom, follow these steps:
Ingredients:
Cardamom
Carrier oil (such as vegetable oil or almond oil)
Glass dropper bottle
Instructions:
a) Start by selecting a high-quality Cardamom. Make sure it is specifically labeled for culinary use.
b) Choose a carrier oil to dilute the cardamom Carrier oils help disperse the flavor and ensure it's safe for consumption. Vegetable oil or almond oil are commonly used as carrier oils.
c) Determine the desired strength of the flavor solution.
d) Prepare a clean glass dropper bottle for storing the flavor solution. Glass bottles are preferred over plastic ones to avoid any potential interaction between the oil and the container.

Addition of excipients:
Excipients are inactive ingredients added to pharmaceutical formulations, including syrups, to aid in the manufacturing process, improve stability, enhance palatability, or facilitate drug delivery.
- Preservatives: Syrups may contain preservatives to inhibit the growth of microorganisms and extend the shelf life of the product. Common preservatives used in syrups include benzoic acid and parabens.
- Stabilizers and Thickeners: Stabilizers and thickeners are added to syrups to improve their consistency, prevent separation, and provide a uniform distribution of the active ingredients.
- Coloring Agents: Coloring agents may be added to syrups to enhance their visual appeal and aid in product identification.
- Flavoring agent: Cardamom

Benefits Of Herb-Herb Combination
Polyherbal formulations designed by the combination of multiple herbs exhibit ample advantages over a single herb and allopathic medicine. This resulted in the emerging trend in herbal drug therapy worldwide [3].

➢ High therapeutic effectiveness against a vast number of afflictions is exerted owing to the presence of numerous phytoconstituents. Factual assessments show an inclination for herbal preparations due to their adequacy and promising outcomes of the treatment [3].
➢ By abolishing the need to administer more than one single herbal formulation at a time, polyherbal preparations bring enhanced convenience for patients. As the administration of multiple herbs as one formulation shows better convenience, it indirectly marks improved patient compliance [4].
➢ The existence of multi-components in the combination serves to potentiate the action of one drug by another. Individual components when utilized alone, this enhancement in activity may not be attainable [4].

Polyherbal formulations have a widespread therapeutic window. Being viable indeed at a lower dose and harmless at a higher dose, most of them have a predominant risk-to-benefit ratio [5].
➢ Herbal combinations with several constituents simultaneously act on diverse targets to elicit intensive alleviation. The presence of distinctive types of constituents remedies the affliction by distinctive mechanisms to provide a complete treatment against an illness [4].
➢ Due to synergism, polyherbal preparations are desirable. They can be prescribed at a lower dose to accomplish the required pharmacological action. This results in decreasing the possibility of harmful side effects as compared to allopathic medication [3][4].
➢ Synergism could be attained at the pharmacokinetic or pharmacodynamic level. Pharmacokinetic synergism is seen when the absorption, distribution, metabolism, and elimination of one herb are facilitated by another in the combination. Pharmacodynamic synergism is achievable by targeting active principles from multiple components toward common physiological systems [3][4].
➢ Having a natural source, developing a polyherbal formulation is economical and it is easily available. Global demand for PHF has increased due to accessibility and affordability, especially in developing countries [3]. More than 700 mono and polyherbal preparation in the form of decoction, tincture, tablets, and capsules from than 100 plants are in clinical use [5]. From this,
polyherbal syrups are more effective and convenient to use.

II. CONCLUSION
Herbal medicines are used by 50% of world population, because of their better acceptability, better compatibility with humans. It has lesser side effects than synthetic ones. In this study we prepared an Polyherbal Syrup using anvarious extraction of polyherbal plant herbals possess an potent severe disorder of disease effect as referred from the literature study. Nowadays, increasing demand for herbal medicine has been increased. People may like to accept the herbal medicine due their lesser side effects.
